## DETAILED ACTION

### *Reasons for Allowance*

1. The following is a statement of reasons for the indication of allowable subject matter:

Claim 1 is allowable over the prior art of record, because the prior art of record does not disclose expressly "a charging circuit for supplying a drive signal to a ramp generator circuit configured to generate the master signal, the charging circuit having first and second current sources for selectably sourcing current to or sinking current from the ramp generator circuit; a tracking input terminal for receiving a tracking signal responsive to the master signal" and "a third current source coupled to the circuit output terminal that generates output current responsive to the op amp output signal, the output current having a magnitude that forces the output of the slave supply to behave in the defined relationship to the master signal when the circuit output terminal is coupled to the feedback input terminal, and the coupling of the third current source to the circuit output terminal presenting a high impedance to the feedback input terminal".

Along with the remaining features of the claim.

Claim 12 is allowable over the prior art of record, because the prior art of record does not disclose expressly "accepting the master signal at a master supply circuit, the master signal varying at a master ramp rate; generating current at the master supply circuit responsive to the master signal; injecting the generated current from the master supply circuit into the feedback input terminal of the slave supply circuit; forcing the output of the slave supply circuit to vary responsive to the master signal and in

accordance with the defined relationship; and presenting a high impedance to the feedback input terminal of the slave supply circuit”.

Claim 20 is allowable over the prior art of record, because the prior art of record does not disclose expressly “providing a power supply with a feedback terminal, an output terminal and a feedback network coupled between the feedback terminal and the output terminal, the feedback network presenting a resistance between the output terminal and the feedback terminal; dynamically changing the resistance of the feedback network responsive to an input indicative of a master signal; and modifying the output of the power supply responsive to the dynamically changing resistance of the feedback network”.
